

Introduction

The Route Optimization agent is an Agentic AI tool that augments the sophisticated capabilities of the [Google Maps Platform Route Optimization API](#) (GMPRO). It is designed to enable developers in Logistics, Local Deliveries, Retail, and Field Services to learn, evaluate, adopt, and gain business value from the capability more quickly

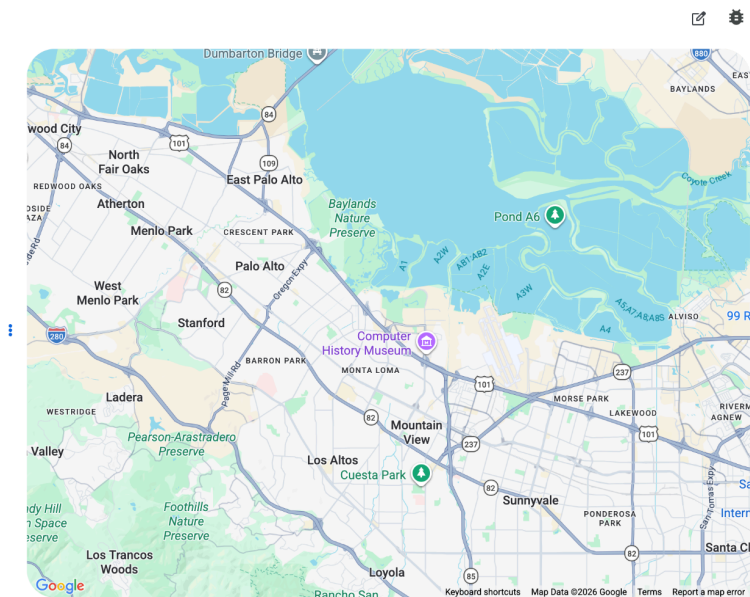

It is currently in the early experimental phase, and we provide this demo tool for users to test the agent and provide us feedback.

Route Optimization Agent

Hi, I'm route optimization agent, how can I assist with your fleet route planning today?

Enter prompt here

Use Cases

The agent supports the following key use cases, each can easily be a time-consuming process with heavy consultation with GMPRO experts:

- **Learning:** Users can interact with the agent to ask questions about the Route Optimization API, such as "How do I model time windows?", "How do I specify vehicle capacity given the shipment load demand?", or "Does it support task clustering? If so, how exactly?"
- **Modeling:** Translate natural language requirements into the corresponding GMPRO modeling and request JSON.
- **Execution and Interpretation:** Running the API with the generated input and summarizing the complex output in natural language (and visualizing the outputs on Maps)

- **Troubleshooting and Refinement:** Explaining the output for specific questions (e.g. why these shipments are skipped), identifying issues in the request, suggesting ways to refine business constraints, and iterating on the solution.

Sample Queries

To get started, you may try the following queries:

- For learning:
 - "Does Route Optimization API support delivery time windows? How?"
 - "How do you model clustering nearby shipments to be delivered back to back with transitionAttributes?"
 - "What is the best way to do vehicle <> shipment eligibility mapping?"
- For requirement modeling, execution, and result summary:
 - "We have 3 shipments to be delivered as fast as possible on time, in the following locations: 37.8970,-122.5817 / 37.8199,-122.4783 / 37.3188,-121.9420. 2 need to be delivered 9am-11am, another one 11am-12pm. Each weighs 1000lbs. The delivery driver works from 9-11:30am starting from 37.8719,-122.2585, using a truck of capacity 2000lbs."
- For troubleshooting (after the result is generated):
 - "Why are there skipped shipments?"
 - "Why is shipment A assigned to vehicle B?"

Report Issues

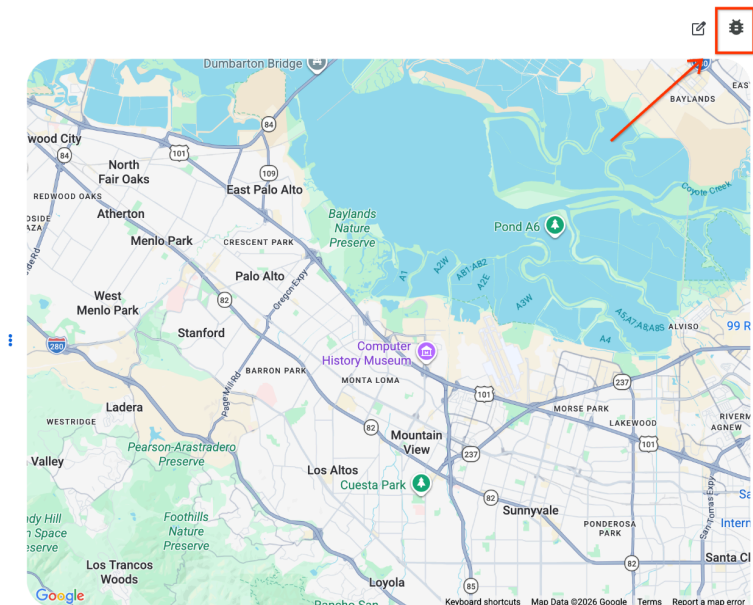

Use the top right corner "bug" icon to report issues or submit your feedback. It also allows us to trace your conversation history and troubleshoot accordingly.

Limitations

This is the very initial experimental version of the agent. Please keep in mind the following known limitations while performing the testing.

- **Latency:** please expect generally high latency in agent response time. The latency also is a function of the complexity of the inquiry and the size of the request / response. You should expect significant improvement in speed over time.
- **Request size:** The agent in its current state is not meant to solve large route optimization problems (in terms of # shipments and vehicles per request). Please test with relatively small requests (e.g. <30 shipments). Having that said, feel free to experiment with some of the sophisticated requirements(e.g. Load capacity, time windows, shipment priorities etc.).
- **Non-Production Use:** The Route Optimization agent is meant for non-production use cases at this point
- **Full accuracy:** We will continuously improve the quality and the accuracy of the agent response over time. Please expect gaps in some use cases, and please report to us when you encounter them.
- **UI:** The demo UI v1 is a tool designed to facilitate the testing, and not a part of the final agent product. We will make incremental improvements to it to improve the testing experience over time, but it's not meant to be a fully polished UI application.

With access to the A2A agent service, feel free to create your own agentic UI app for interactive testing.
